Submitted (NOV-2000) to the EMBL/GenBank/DDBJ databases.

LO CATALYZES THE COVALENT ATTACHMENT OF UBIQUITIN TO OTHER PROTEINS (BY SIMILARITY).

- I- CATALYTIC ACTIVITY: ATP + UBIQUITIN + PROTEIN LYSINE - AMP +

DIPHOSPHATE + PROTEIN N-UBIQUITIN/SINE).

- I- PATHWAY: UBIQUITIN CONJUGATION; SECOND STEP.

- I- PATHWAY: UBIQUITIN CONJUGATION; SECOND STEP.

- I- MISCELLANEOGS: A CYSTEINE RESIDUE IS REQUIRED FOR UBIQUITIN-

THIOLESTER FORMATION (BY SIMILARITY).

- INILARITY: BELONGS TO THE UBIQUITIN-CONJUGATING ENZYME FAMILY.

-! CATALYTIC ACTIVITY: ATP + UBIOUTIN + PROTEIN LYSINE - AMP + DIPHOSPHATE + PROTEIN N-UBIOUTINLESINE.
-! PATHAAX: UBIOUTIN CONJUGATION; SECOND STEP.
-! MISCELLANEOUS: A CYSTEINE RESIDUE IS REQUIRED FOR UBIQUITIN-
THIOLESTER FORMATION (BY SIMILARITY).
-! SIMILARITY: BELONGS TO THE UBIQUITIN-CONJUGATING ENZYME FAMILY.
EMBL; ALO09196; CAA15712.1; -

-!- FUNCTION: CATALYZES THE COVALENT ATTACHMENT OF UBIQUITIN TO OTHER PROTEINS (BY SIMILARITY).
-!- CATALYTIC ACTIVITY: APP + UBIQUITYLLYSINE.
-!- PATHWAY: UBIQUITYLLYSINE.
-!- PATHWAY: A CYSTEINE RESIDUE IS REQUIRED FOR UBIQUITIN-
-!- THIOLESTER FORMATION (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    277 ELVNDSLYDWNVKLLKVDQDSALHNDLQILKEKEGADFILLNFSFKDNFPFDPFVRVVS

homologue, RATLIG6 (regulated in activated T-lymphocytes 1d6) and its corresponding nucleic acid. The invention also relates to methods for treating, diagnosing, preventing and screening for disorders related to the expression of RATLIG6: UBC is useful for screening for candidate computed scapable of binding to and/or modulating its activity. UBC is useful for treating an immune or neuronal disorder in a mammal. The method is useful for treating a cancer or tumour. It is useful for suppression the immune response in a subject requiring the suppression. It is also useful for treating lymphoproliferative disorder, cancer e.g. adenocarcinoma, lenkaemia, myeloma, sarcoma, etc, neurodegenerative disorder, inflammatory disorders e.g. rheumatoid arthritis, asthma, multiple sclerosis, psoriasis, etc, neuronal disorders e.g. Alzheimer's disease, dementia, depression, epilepsy, etc, immune disorder or immune related disorders such as acquired immuno deficiency syndrome (AIDS), alleay, anaemia, atopic dermatitis, diabetes mellitus, myocardial infarction, etc, developmental disorders e.g. Cushing's syndrome, renal infarction, etc, developmental disorders e.g. Cushing's syndrome, renal tresent sequence is human RATLIG6 gene.
                                                                                                                                                                                                                                                                                                          Novel ubiquitin conjugating enzyme polypeptide isolated from activated human T cell, for screening modulators useful for treating cancer, immune disorder, lymphoproliferative disorder, neurodegenerative

AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and cancer antigens. The colon cancer antigens have cytostatic activity and cancer antigens. The colon cancer antigens have cytostatic activity and cancer in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with the prevention, or disease, associated with decreased expression by rectifying mutations or deletions associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps. by inserting the nucleic acids into a host cell and culturing the cell of colorectal carcinomas and cancers. AAH37196 to AAH37204 and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAH37789 represent sequences used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes novel nucleic acid sequences (A) that are expressed at high level in normal prostatic tissue. Polypeptides (I) perioded by (A) are used. (a) for identifying agents for treatment of prostatic cancer and (b) for therapy of prostate cancer, optionally where expressed by gene therapy methods. (A) is also used to isolate full-length genes (for gene therapy) and for recombinant production of (I), which can be used to raise specific antibodies. (A) are identified by assembly of ESTs (expressed sequence tags) before these are analyzed for expression pattern (tissue specificity). This approach eliminates many of the false results, as regards tissue specificity, associated with known methods that use single (usually short) ESTs. Associated with known methods that use single (usually short) ESTs. Associated represent expressed sequence tags described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9

The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipsorlan; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinfammatory; antibacterial; antiviral; antifungal; antinheumatic; antitinfammatory; antibacterial; antiviral; antifungal; antinheumatic; the presence of or predisposition to, or preventing or treating the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers,

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; heaptortopic; vulnerary; sequences have activities such as: cytostatic; heartoprotective; cartiparkinsonian; nootropic; neuroprotective; manunostimilant; cardiant; thrombolytic; coagulant; vasotropic; munnostimilant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; or predisposition to, or preventing or treating the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy proliferative disorders, neurodegenerative disorders, osteoarthritis, proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, humans, and the proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, humans, and the proteins and nucleic acids may be used to treat cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance

                                                                                                                                                                                                                                The present invention provides the protein and coding sequences of 444 novel human proteins. These were isolated from expressed sequences tags (ESTS). They can be used to stimulate cell growth, to regulate haematopoiesis e.g. to treat aplastic anaemia, to help tissue regrowth e.g. in burn treatment, to regulate the immune system e.g. to treat multiple sclerosis, to regulate he activin or inhibin e.g. to treat infertility, to regulate haemostasis or thrombolysis e.g. to treat stroke and cancer, to screen for drugs, to treat inflammatory conditions e.g. rheumatoid arthritis, and to treat nervous system disorders e.g. Parkinson's disease. The present sequence is a coding sequence of the

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a cytostasic activity. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, drug efficacy and drug metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               part of the printed directly from WIPO

```
A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7817 "CS" sequences given in AAr19001-T26873 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared if com a various human tissues; synthesis of CDNA was initiated from the 3'-end of mRNA by using poly!" as the sole primer. Since the 3'-end of mRNA by using poly!" as the sole primer. Since the 3'-end of mRNA by using poly!" as the sole primer. Since the 3'-end of mRNA hybridise with specific mRNAs Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.
                                                                                                                                                                                                                                                                         Similarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         40200212327-A2

human secreted proteins given in AAB34299 to AAB34347. AAB34348 to AAB34437 represent human secreted polypeptide sequences and proteins amonicogues to them, which are given in the exemplification of the present invention. Human secreted polypeptide sequences and proteins and calls the genes are expressed in Example of activities include: neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular active general; vulnerary; gastrointestinal; nephrotroptc; muscular antiinfective; gynaecological; and antibacterial. The polynucleotides can be used for the detection of various disorders such as cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The secreted proteins can be used to treat disorders such as neural; immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wound healing, and infectious diseases. The proteins can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 3452 GGGCCGATCGCACCCCCCGTGCCGACGACCATTCGAACGTCTGCCCTATCAACT

                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method of identifying a compound that modulates attention deficit hyperactivity disorder (ADHD) in a mammal. The method comprises administering a test compound to an invertebrate, and measuring a foraging behaviour of the invertebrate is characterised as a compound that modulates to the invertebrate is characterised as a compound that modulates. Of the invertebrate is characterised as a compound that modulates in a mammal. The compound identified by the new method of the invention is useful for diagnosing or treating ADHD, hypertension or other diseases associated with a nitric oxide/cMP-dependent protein distinguishes a compound that has a specific effect on ADHD, hypertension or other diseases associated with a compound that has a specific effect on ADHD, hypertension or other diseases associated with a mammal from a compound that has a non-specific effect. The present sequence represents a DNA sequence associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       4022
